UVOD

Register raka za Slovenijo (Register) je eden najstarejših populacijski registrov v Evropi. Ustanovljen je bil leta 1950 na Onkološkem inštitutu v Ljubljani kot posebna služba za zbiranje in obdelavo podatkov o incidenci raka in preživetju bolnikov z rakom. Pred letom 1950 so bili populacijski registri raka le v Hamburgu, na Danskem in v Veliki Britaniji. Od ustanovitve do leta 1975 je Register vodila pokojna profesorica dr. Božena Ravnihar, dolgoletna direktorica Onkološkega inštituta. Njeno delo je nato prevzela profesorica dr. Vera Pompe Kirn, ki je do leta 2003 skrbela za nadaljnjo uveljavljanje Registra v domačem in mednarodnem merilu. Tega leta je Onkološki inštitut dobil nov statut, ki je združil Register z Enoto za epidemiologijo v enotno službo Epidemiologija in register raka. V njej so poleg Registra še bolnišnični register Onkološkega inštituta, oddelek za epidemiologijo, kjer tečejo epidemiološke raziskave, in na novo ustanovljeni Register organiziranega presejanja za raka materničnega vratu (ZORA), kjer je tudi koordinacija državnega programa presejanja za raka materničnega vratu.

Prijavljanje raka je že od ustanovitve Registra v Republiki Sloveniji obvezno in zakonsko predpisano (Ur. l. SRS, št. 10/50, št. 29/50, št. 14/65, št. 1/80, št. 45/82, št. 42/85; Ur. l. RS, št. 9/92 in št. 65/00). Zbrani podatki so podlaga za ocenjevanje bremena rakavih bolezni v državi, za načrtovanje in ocenjevanje onkološkega varstva na področju primarne in sekundarne preventive, diagnostike, zdravljenja in rehabilitacije, za načrtovanje zmogljivosti in sredstev, ki so potrebni za obvladovanje rakavih bolezni (osebje, medicinska oprema, posteljne zmogljivosti), ter za klinične in epidemiološke raziskave v Sloveniji in v sklopu širših mednarodnih raziskav

Populacijski register raka opravičuje svoj obstoj, če se zbrani podatki tudi redno obdelujejo, objavljajo in uporabljajo. Ena izmed stalnih oblik vračanja obdelanih informacij so letna poročila. Ker je virov informacij več, je čas, potreben za dokončanje zbirke, povezavo in objavo podatkov pri nas in po svetu daljši, običajno 2 do 3 leta.

Register je prva letna poročila izdajal že v letih 1953-57 za leta 1951-55. Prva analiza podatkov za leto 1950 je bila objavljena v **Zdravstvenem**

INTRODUCTION

The Cancer Registry of Slovenia (Registry) is one of the oldest population-based registries in Europe. It was founded in 1950 at the Institute of Oncology in Ljubljana as a special service for collecting and processing data on cancer incidence and cancer patients' survival. Before 1950, population-based registries existed only in Hamburg, Denmark and in Great Britain. From its foundation and until 1975, the Registry was headed by the late Professor Božena Ravnihar who was also director general of the Institute of Oncology for almost 20 years. At the Registry, she was succeeded by Professor Vera Pompe-Kirn who successfully carried on her work until last year and contributed a lot to the further development of the Registry as well as to its promotion and recognition at the national and international level. Last year, a new Statute was adopted by the Institute that enacted the merging of the Registry and Epidemiology Unit in a single service, Epidemiology and Cancer Registry. The new service comprises, besides Cancer Registry of Slovenia, also the hospital-based Cancer Registry of the Institute of Oncology, Epidemiology Unit for epidemiologic studies and the newly established Cancer Screening Registry, a unit that is in charge of coordinating the nationally organised cervical cancer screening programme.

Notification of cancer has been compulsory in Slovenia since the foundation of the Registry and is prescribed by law (Official Gazette of SRS, No. 10/50, No. 29/50, No. 14/65, No. 1/80, No. 45/82, No. 42/85; Official Gazette of RS, No. 9/92 and No. 65/00). The data collected serve as the basis for assessing the cancer burden in the country, for programming and evaluating primary prevention, diagnosis, treatment and rehabilitation, planning facilities and funding needed for cancer control (personnel, equipment and hospital capacities) as well as for clinical and epidemiological research in Slovenia and in international multicentric studies.

The existence of a population-based cancer registry is justified only by regular processing, publishing and using the data collected. The Registry's Annual Reports are one of the regular ways of disseminating information. Because of a variety of data sources, data collection, their linking and publication is rather time consuming (with us and elsewhere) and usually takes two to three years.

vestniku leta 1951. Podatki za leta 1957-71 so bili objavljani v periodičnih publikacijah Svetovne zdravstvene organizacije **Epidemiological and Vital Statistics** in v **World Health Statistics Report**. Od leta 1965 so bili podatki spet redno objavljani v posebnih letnih poročilih z naslovom **Rak v Sloveniji** (1965-77) in **Incidenca raka v Sloveniji** (1978-2000), in sicer v slovenskem in angleškem jeziku. Za vsebino publikacije skrbi uredniški odbor, v katerem smo zbrani specialisti raznih vej onkologije. Glede na želje in predloge uporabnikov letna poročila iz leta v leto dopolnjujemo, vendar skrbimo tudi za to, da so objavljeni podatki iz leta v leto primerljivi.

Incidenca raka je po svetu zelo različna, za raziskovanje teh razlik pa so ključni kakovostni podatki. Prav zato so bili in so naši podatki o incidenci raka zanimivi tudi za svet. Leta 1957 je izšlo prvo obsežnejše poročilo za leta 1950-55 v angleščini. Podatke za leta 1956-60, 1961-65, 1968-72, 1973-76, 1978-81, 1982-87, 1988-92 in 1993-97 so objavili tudi v vseh osmih zvezkih knjige **Cancer Incidence in Five Continents**, ki jo izdaja Mednarodna agencija za raziskovanje raka. Podatki o incidenci in umrljivosti za rakom so vključeni tudi v mednarodne podatkovne baze **EUROCIM, GLOBOCAN, ACCIS**, preživetje slovenskih bolnikov pa je obdelano v mednarodnih študijah **EUROCARE II** in **EUROCARE III**.

Zbrane podatke v Registru obdelujemo in pojasnjujemo v skladu s trenutno perečo problematiko v Sloveniji, z lastnim raziskovalnim programom in s predlogi uporabnikov. Izsledke objavljamo v člankih v domačem in tujem strokovnem in poljudnem tisku. Med najpomembnejšimi so tri knjige: **Zemljevidi incidence raka v Sloveniji 1978-1987**, **Preživetje bolnikov z rakom v Sloveniji 1963-1990** in **Preživetje bolnikov z rakom v Sloveniji 1983-1997**. Seznam drugih pomembnejših del, objavljenih v zadnjih petih letih, je v dodatku na koncu poročila.

Letošnje poročilo je v celoti dostopno v elektronski obliki na spletni strani Onkološkega inštituta <http://www.onko-i.si>.

The first annual reports of the Registry for the period 1951-55 were issued during the years 1953-57. The first data analysis for the year 1950 was published in **Zdravstveni vestnik** in 1951. The data for the period 1957-71 were appearing in the periodicals **Epidemiological and Vital Statistics Report** and **World Health Statistics Report**, both edited by World Health Organization. From 1965 onwards, the data have been appearing regularly in special bi-lingual (Slovene-English) annual reports, first entitled **Cancer in Slovenia** (1965-77), and then **Cancer Incidence in Slovenia** (1978-2000). The editorial board, responsible for the contents of the report, consists of experts of different specialties in oncology. Our endeavours have always been directed towards further improvement of these publications, by taking into account as much the requests and comments of the users as the comparability of the data from year to year.

There are great differences in cancer incidence among different populations and to evaluate them, good quality data are needed from different parts of the world. That is why our data on cancer incidence have always been interesting also for professional public abroad. In 1957, the first comprehensive report, covering the period 1950-55, was issued in English under the title **Cancer in Slovenia 1955**. The data for the periods 1956-60, 1961-65, 1968-72, 1973-76, 1978-81, 1982-87, 1988-92 and 1993-97 were published in all eight volumes of the **Cancer Incidence in Five Continents** issued by International Agency for Research on Cancer. The data on cancer incidence and mortality for the years 1983-99 were also included in international databases **EUROCIM, GLOBOCAN, ACCIS**. The survival of Slovenian cancer patients is included into and analysed by the international studies **EUROCARE II** and **EUROCARE III**.

The data collected have been processed in accordance with the current problems in Slovenia, as well as with respect to our research program and suggestions from our users. These data are published in national and foreign medical literature and as publications for lay readers. Among the most important are three special publications: **Atlas of Cancer Incidence in Slovenia 1978-1987**, **Cancer Patients' Survival in Slovenia 1963-1990** and **Cancer Patients' Survival in Slovenia 1983-1997**. The list of other relevant publications is at the end of this report.

The current annual report is available in pdf format on the website of the Institute of Oncology: <http://www.onko-i.si>.

GRADIVO IN METODE

Osnovni vir podatkov so prijavnice rakave bolezni. Registru jih pošiljajo iz vseh bolnišnic in diagnostičnih centrov v Sloveniji, iz ordinacij osnovnega zdravstvenega varstva pa le izjemoma, če bolnik ni napoten na nadaljnje preiskave in/ali zdravljenje. Dodatni vir podatkov so zdravniška poročila o vzroku smrti in obdukcijski zapisniki z diagnozo maligne bolezni. Zbiranje podatkov za to letno poročilo smo zaključili 31. januarja 2003.

Zanesljivost podatkov osvetljujeva dva kazalca: odstotni delež raka, registriranega samo iz zdravniških poročil o vzroku smrti (tabela 3), in odstotni delež mikroskopsko (histološko ali citološko) potrjenih primerov (tabela 7). Majhen delež primerov, prijavljenih po izdaji letnega poročila v raznih časovnih obdobjih, kaže, da do izdaje poročila registriramo večino novih primerov raka. Ta delež je stabilen in kaže na popolnost podatkov (slika 3).

Od leta 1993 je obvezno prijavljanje sprememb materničnega vratu, označenih kot CIN III (šifra 219 po 8. reviziji MKB), dotlej pa so se registrirale le spremembe, označene v tabelah s šifro 234.0 (karcinom in situ). Primerjava s podatki za obdobje 1961-92 tako ni možna. Po 10. reviziji MKB so vse intraepiteljske spremembe materničnega vratu uvrščene v šifro D06. Od leta 1995 registriramo tudi prijavljene intraepiteljske karcinome mehurja in maligne melanome Clark I.

Za razvrščanje neoplazem po lokacijah Register od leta 1997 uporablja **10. revizijo Mednarodne klasifikacije bolezni, poškodb in vzrokov smrti**, do takrat pa je uporabljal **osmo**. Za vse, ki želijo primerjati podatke iz prejšnjih poročil, je dodana tabela 4b. Klasifikaciji različno uvrščata bolezni med maligne, zato število novih primerov raka po obeh klasifikacijah ni enako.

Prav pri uvrščanju med maligne bolezni je treba opozoriti še na klasifikacijo za morfologijo neoplazem. Podatki za leto 2001 so razvrščeni po morfološkem delu tretje izdaje Mednarodne klasifikacije bolezni za onkologijo. V tej izdaji je nekaj sprememb, tudi katere histološke vrste sodijo med maligne. Po tretji reviziji so med maligne uvrščene kronične mieloproliferativne bolezni in mielodisplastični sindromi (sedaj v

MATERIAL AND METHODS

The main sources of data are notifications gathered from all hospitals and diagnostic centres in Slovenia, exceptionally also from primary health care centres in case the patient was not referred for further diagnostic investigations. This information is completed by death certificates and autopsy protocols stating cancer diagnosis. The collection of data for the current report was completed on January 31, 2003.

The reliability of information can be assessed by two parameters: the percentage of cancer cases registered solely on the basis of death certificates (Table 3), and by the percentage of microscopically (histologically or cytologically) confirmed cases (Table 7). The small and stable proportion of cases registered after the publication of annual reports shows that the majority of cases are reported to the Registry by the time of the publication of annual reports and that the registration is complete (Figure 3).

In 1993, compulsory registration of all cervical intraepithelial dysplasias classified as CIN III was introduced (code 219 according to ICD-8). Till then, only carcinoma in situ (code 234.0) was registered. Thus, the comparison with the data for the period 1961-1992 is not possible. According to ICD-10, all cervical intraepithelial neoplasms (in situ and CIN III) are coded as D06. Since 1995, the number of all reported intraepithelial carcinomas of the bladder and all malignant melanomas Clark I have been registered.

Since 1997, cancer sites are coded according to the 10th revision of the **International Statistical Classification of Diseases and Related health Problems (ICD-10)**; before, the 8th revision was used (ICD-8). As in earlier reports, Table 4b contains also the data coded according to the 8th revision in order to allow the comparison with the earlier reports. There are differences in coding neoplasms as malignant or benign according to both classifications, so, according to the two classifications, the number of new cancer cases is not equal.

When classifying tumours as malignant, the behaviour digit of the morphology code of the third edition of **International Classification of Diseases for Oncology** is used in the current annual report. In this edition, some changes were introduced in terms of morphology and behaviour code. According to this classification,

topografski šifri C96.7). V skladu z novimi pravili tudi mejno malignih ovarijskih tumorjev ne uvrščamo več v kategorijo C56, pač pa v D39.1.

Opozarjamo še, da so v tabeli 8 histološke vrste združene v nove, drugačne skupine kot v prejšnjih poročilih in so prilagojene tretji reviziji morfološkega dela Mednarodne klasifikacije bolezni za onkologijo.

DEFINICIJE

Incidenca pomeni število vseh v enem koledarskem letu na novo ugotovljenih primerov raka v točno določeni populaciji. V incidenco ne štejemo novih primarnih rakov parnega organa iste lokacije, če je bila histološka vrsta obeh rakov, npr. leve in desne dojke, enaka. Prav tako v incidenco ne štejemo novega pojava raka iste histološke vrste na istem organu, npr. multiple lezije v debelem črevesu. V incidenco so vključeni primeri bolezni bolnikov s stalnim bivališčem na območju Republike Slovenije, ne glede na to, kje so bili ti bolniki zdravljeni.

Prevalenca je število vseh živih bolnikov z rakom na določen datum ne glede na leto diagnoze.

Groba incidenčna stopnja je število novih primerov na 100.000 oseb opazovane populacije, **starostno specifična stopnja** pove to relativno število v posamezni petletni starostni skupini.

Kumulativna incidenčna stopnja (v zadnjem stolpcu tabele 5) je petkratna vsota starostno specifičnih incidenc na 100 prebivalcev posameznih petletnih starostnih skupin do 74. leta starosti. Je neposredna, na dejansko populacijo posamezne petletne starostne skupine standardizirana incidenca ali približek kumulativnemu tveganju. Kumulativno tveganje je verjetnost posameznika, da zbolí za rakom v izbranem starostnem obdobju, npr. do 74. leta starosti, za rakom (če, seveda, ne umre prej zaradi drugih vzrokov). Kumulativno stopnjo računamo na 100 in jo izražamo v odstotkih. Kumulativna stopnja raka dojk pri ženskah 6,4/100 pomeni, npr., da bo verjetno 6,4 % deklic, rojenih leta 2001 (ali ena od 16) do 75. leta starosti zbolelo za rakom dojk.

Starostna standardizacija je potrebna, če analiziramo incidenco v daljšem časovnem obdobju

chronic myeloproliferative disorders and myelodysplastic syndromes are classified as malignant (topography code C96.7), while ovarian tumours of borderline malignancy are currently coded as D39.1 (and not C56).

It should be noted that in Table 8 the morphology codes are grouped in new categories and are adapted to the third revision of morphology part of International Classification of Diseases for Oncology.

DEFINITIONS

Incidence is the number of newly diagnosed cancer cases in a defined population, reported to the Registry for a given calendar year. New primary cancers of the same histology in paired organs, e. g. on the left and right breast, are not comprised in the incidence figures, neither are any new cancers of the same histology appearing in the same organ, e.g. multiple lesions of the colon. The incidence includes only the data on patients with permanent residence in Slovenia, regardless of the place of treatment.

Prevalence is the number of all surviving cancer patients, irrespective of the year of diagnosis.

Crude incidence rate is the number of new cases per 100.000 population, while the age specific rate expresses this relative number in an individual five-year age group.

The cumulative incidence rate (the last column in Table 5) is five times the sum of the age-specific incidence rates per 100 population, calculated over five-year age groups up to the age of 74 years. It is a directly age-standardized rate with the same population size in each age group, or as an approximation to the cumulative risk. The cumulative risk is the risk an individual would have of developing the disease in question during a certain age period if no other causes of death were in operation. The cumulative rate is expressed per hundred (per cent). Thus, the cumulative rate (0-74) of 6.4/100 for breast cancer in females means that 6.3% of women (each 16th woman) are expected to develop breast cancer by their age of 75.

When analysing the incidence rate within longer time period (if the age structure of population changes) or comparing the incidence

(če se starostna struktura prebivalstva v času spreminja) ali če primerjamo incidenco med populacijami z različno starostno strukturo. Ena od možnosti je uporaba kumulativne stopnje incidence, kot je za Slovenijo prikazana na spodnjem delu slike 5. Primerjava oblike krivulj grobih in kumulativnih stopenj na sliki 9 kaže, da povečevanja incidence raka ne moremo pripisati le staranju prebivalstva RS, ampak da k temu prispevajo še drugi nevarnostni dejavniki. Kumulativne stopnje smo uporabili tudi pri zemljevidih. V tabeli 6b je za primerjavo incidenčnih stopenj med slovenskimi zdravstvenimi regijami uporabljena neposredna metoda starostne standardizacije; za standard je uporabljena starostna struktura prebivalcev Slovenije ob popisu leta 2002.

POJASNILA

Slike 1-4 prikazujejo osnovne podatke o bremenu raka v Sloveniji: število vseh zbolelih in umrlih za rakom v letu 2001, prevalenco in najpogostejše rakave bolezni po spolu.

Sliki 5 in 6 opozarjata na različno breme raka v raznih življenjskih obdobjih; rak je skoraj izjema pri mladih do 19 let; če pa zbolijo, najpogostejše za levkemijo. Štiri odstotke vseh rakov je med 20. in 34. letom starosti, ko je pri moških najpogostejši rak mod, pri ženskah pa rak materničnega vratu. Pljučni rak pri moških in rak dojke pri ženskah sta na prvem mestu od 35. leta starosti, več kot tri četrtine vseh rakov pa je pri bolnikih, starejših od 50 let.

Na **sliki 7** so prikazane grobe incidenčne stopnje vseh rakov po zdravstvenih regijah po spolu, na **sliki 8** pa odstotni delež, za katerega posamezne regije odstopajo od slovenskega povprečja. Med najbolj obremenjenimi izstopajo ljubljanska in novogoriška zdravstvena regija. Ti podatki so pomembni za načrtovanje zdravstvenih zmogljivosti. Starostno standardizirane incidenčne stopnje (tabela 6b) pa kažejo, da je pretežni del razlik med regijami posledica različne starostne strukture njihovih prebivalcev.

Sliki 9 in 10 kažeta trende incidence vseh in izbranih rakov po spolu. V letu 2001 smo pri grafičnih prikazih v eno skupino združili rake debelega črevesa in danke in v drugo rake ust, žrela

between populations with different age structure, **age standardisation** is needed to adjust the rate for the effect of age. One of the methods is the cumulative rate as in Figure 9 (bottom). The comparison of the curves of crude incidence per 100.000 population and cumulative incidence rates in Figure 9 indicates that the increasing cancer incidence rate in both sexes cannot be attributed only to the aging of population, but also to additional risk factors. Cumulative rate is used also in cancer maps. In Table 6b, direct age standardisation of the Slovenian population derived from the 2002 census is used as standard for the comparison of incidence rates between health regions, controlling for differences in their age composition.

COMMENTS

Figures 1-4 present the data on cancer burden in Slovenia: the number of new, deceased and prevalent cancer patients in 2000 and the most frequent cancer sites by sex.

Figures 5 and 6 point to the different proportion of cancer in different age groups; up to the age of 19, cancer is more an exception, with leukaemia being the most frequent cancer in this age group. Four percent of all cancers develop in the age group of 20-34 years, in which the most frequent is testicular cancer in males and cervical cancer in females. The lung in males and the breast in females are the most frequent cancer sites after the age of 35; more than three quarters of all cancers develop after the age of 50.

Figure 7 shows crude cancer incidence rates in nine health regions, while in **Figure 8**, the percentage deviation from Slovenian average incidence rate is presented. The highest incidence rates are in the Ljubljana and Nova Gorica region. While these data are important for planning health care facilities, the age standardised rates in Table 6b indicate that the majority of differences are due to different age structure of population in these regions.

Figures 9 and 10 show the incidence trends for all and selected sites by sex. In graphical presentations, colon and rectal cancers are grouped in one category as colorectal, as well as oral, pha-

in grla (glava in vrat). Opozoriti velja, da se v letu 2001 nadaljuje zmanjševanje incidence pljučnega raka pri moških, kar je odsev manjšanja deleža rednih kadilcev med odraslimi moškimi v zadnjih 20 letih.

S **slikami 11 do 16** zaključujemo prvi krog ponovnih objav zemljevidov incidence raka od izida knjige Zemljevidi incidence raka v Sloveniji 1978-87. Tokrat poleg zemljevidov grobe in kumulativne incidenčne stopnje po spolu za vse rake, levkemije in ledvičnega raka v letih 1992-2001 prikazujemo še trend incidence in umrljivosti in starostno specifično incidenco.

Tabele prikazujejo podatke o prebivalcih in incidenci raka v Sloveniji leta 2001 po spolu, starosti, lokaciji, histološki vrsti in stadiju bolezni ob diagnozi, o incidenci po zdravstvenih regijah ter podatke o številu novih primerov raka, ugotovljenih v tem letu po posameznih bolnišnicah, število smrti za rakom po spolu, starosti in lokaciji ter prevalenco najpogostejših rakov.

Iz **tabel 3, 4a, 7 in 8** je mogoče povzeti, da je bilo leta 2001 na novo registriranih 9058 primerov raka, 149 (2 %) samo na osnovi zdravniškega poročila o vzroku smrti (tabela 3). Ta delež, ki je že več let podoben, kaže bolnike, ki verjetno zaradi starosti ali napredovale bolezni niso bili zdravljeni v bolnišnici. Od 8909 bolnikov, ki so jim diagnozo postavili v bolnišnicah ali diagnostičnih centrih, je bila pri 8318 (93 %) bolezen potrjena mikroskopsko (tabela 7). Kakšna je bila morfološka slika malignomov, kaže **tabela 8**. V njej so posebej primeri, ki so potrjeni histološko (88 %) in tisti, ki so bili potrjeni samo citološko (12 %).

Po 8. reviziji MKB, po kateri so raki razvrščeni v **tabeli 4b**, je novih primerov raka 8999. Razlika za 59 primerov je posledica novega razvrščanja neoplazem glede na tretjo izdajo morfološkega dela Mednarodne klasifikacije bolezni za onkologijo.

Tabela 5 prikazuje grobo in starostno specifično incidenčno stopnjo na 100.000 prebivalcev ter kumulativno stopnjo na 100. Število vseh novih primerov raka iz leta 2001 je preračunano na število prebivalcev R Slovenije na dan 30. junija 2001.

V **tabeli 6a** je število novih primerov vseh in izbranih rakov prikazano po zdravstvenih regijah. Te številke so pomembne za načrtovanje zdravstvenih zmogljivosti. V **tabeli 6b** starostno

ryngeal and laryngeal cancers as head and neck. It should be noted that, in 2001, the incidence of lung cancer in males decreased by 10% compared to the year 2000, which is a reflection of the decreasing proportion of smokers among adult males in the last 20 years.

With **figures 11-16**, the first cycle of new maps on cancer incidence, appearing since the publication of Atlas of Cancer Incidence in Slovenia 1978-1987, is closed. Along with the maps on crude and cumulative rates of all cancer sites, leukaemias and kidney cancers in the years 1992-2001, trends in incidence and mortality and age specific rates are presented.

Tables show the data on population and on cancer incidence in Slovenia in 2001 by sex, age, primary site, histology, stage of the disease at diagnosis, on the incidence in the individual health regions, and on new cancer cases diagnosed in the current year in different hospitals in Slovenia, on deaths and on prevalence of most frequent cancer sites.

Tables 3, 4a, 7 and 8 show that, in the year 2001, 9058 new cancer cases were registered, 149 (2%) from death certificates only (Table 3). This percentage has been similar for several years and represents those patients that, due to advanced age or disease have not been treated in the hospital. From 8909 cases, diagnosed in hospitals or diagnostic centres, 8318 (93 %) diagnoses were confirmed microscopically (Table 7). The morphology of tumours is presented in Table 8, where histologically verified cases (88 %) are presented separately from those confirmed by cytology only (12 %).

In **Table 4b**, the diagnoses are coded according to the 8th revision of International Classification of Diseases. According to this classification, 8999 new cancer cases were detected. The difference of 59 cases is due to new morphology classification of the third revision of International Classification of Diseases for Oncology.

Table 5 shows crude and age specific incidence rate per 100.000 population and cumulative rate per 100. For calculation of crude rate, the Slovenian population census on June 30, 2001 was used.

In **Table 6a**, the number of new cases of all and selected cancer sites by different health regions is presented. These numbers are important for planning health care facilities. The age

standardizirana incidenca kaže, da so razlike med regijami tudi posledica različnega deleža starejših.

Tabela 9 kaže starostno porazdelitev ekstranodalnih in nodalnih lokacij ne-Hodgkinovih malignih limfomov. Ker je število ekstranodalnih lokacij majhno, so prikazane le absolutne številke.

Iz **tabele 10** je razvidno, kje vse bolnikom postavijo diagnozo. Tako kot že vrsto let, polovica od vseh bolnikov z rakom, ki jim diagnozo postavijo v slovenskih bolnišnicah ali jih tam tudi začnejo zdraviti, v nadaljnjem poteku bolezni pride na posvet ali na zdravljenje na Onkološki inštitut.

Tabela 11 prikazuje porazdelitev bolnikov po stadiju, v katerem je bila bolezen odkrita. Uporabljena je poenostavljena opredelitev stadijev, ki upošteva vse preiskovalne metode, vključno operacijo; če bolnik ni bil poprej zdravjen, tudi obdukcijo. Uporabljamo in navajamo jo zato, ker so podatki o stadiju bolezni po klasifikaciji TNM na prijavnica pogosto pomanjkljivi. Poenostavljena opredelitev stadijev pri solidnih tumorjih praviloma sledi klasifikaciji TNM. V omejeni stadij je razvrščena bolezen, kjer je tumor označen kot T1 in T2 (razen pri dojki, malignem melanomu in ščitnici, kjer so vključeni tudi tumorji T3, in materničnem vratu, telesu in sarkomih, kjer so vključeni le tumorji T1) in pri kateri niso prizadete regionalne bezgavke in ni zasevkov v oddaljenih organih (N0, M0). V stadiju regionalne razširitve je bolezen, kjer je tumor opredeljen kot T3 in T4 (razen v omenjenih izjemah) in/ali so prizadete tudi regionalne bezgavke (N 1), zasevkov v oddaljenih bezgavkah in organih pa ni (M0). V stadiju oddaljene razširitve pa je tista bolezen, pri kateri so zasevki že v oddaljenih bezgavkah ali organih (M 1). Maligni limfomi so opredeljeni po klasifikaciji Ann-Arbor.

V **tabeli 12** so uradni podatki o umrljivosti za rakom. Tabela je pripravila dr. Jožica Šelb-Šemrl z Inštituta za varovanje zdravja RS.

Tabela 13 prikazuje prevalenco vseh in najpogostejših rakov na dan 31. 12. 2001.

Preživetja bolnikov tokrat ne prikazujemo, saj je lani izšla knjiga **Preživetje bolnikov z rakom v Sloveniji 1983-1997** z izčrpnimi podatki in komentarji klinikov. Vse, ki se zanje zanimate, vabimo, da knjigo naročite v Registru.

standardised rates in **Table 6b** indicate that the majority of the differences are due to different age structure of population in these regions.

Age distribution of extranodal and nodal sites of non-Hodgkin malignant lymphomas is presented in **Table 9**. Owing to a small number of extranodal sites, only the absolute numbers are given.

From **Table 10** it is evident, in which hospitals cancer cases are diagnosed. Observations of many years show that half of the patients diagnosed or initially treated in regional hospitals are later on referred to the Institute of Oncology Ljubljana.

A simplified definition of stages at diagnosis is presented in **Table 11**. The simplified definition is based on all investigation methods, including surgery. In case the patient was not treated before death, the autopsy record is considered as well. The simplified stage definition is used because, in cancer notification forms, the data on stage according to TNM Classification System are often lacking. However in solid tumours, the simplified stage definition often follows the TNM Classification. Localised stage includes all cancers where the tumour has been classified as T1 and T2 (except in breast, malignant melanoma and thyroid cancer, where T3 is also included, and uterine cervix, uterine corpus and sarcomas, where T1 only is included), where neither regional node involvement nor distant metastases are found (N0, M0). The regional stage includes tumours classified as T3 and T4 (exceptions already mentioned) and/or regional node metastases (N 1), if no metastases in distant lymph nodes or organs (M0) are found. The disease with metastases in distant nodes or organs is classified as the remote stage (M 1). Malignant lymphomas are classified according to AnnArbor System.

Official data on cancer mortality are given in **Table 12**. The table has been prepared by Dr. Jožica Šelb-Šemrl from the Institute of Public Health of the Republic of Slovenia.

Data on prevalence of all and most frequent cancers are presented in **Table 13**.

Survival of cancer patients is not presented in current report because they are presented in Cancer Patients Survival in Slovenia 1983-1997, which was published last year and contains also comments of clinicians specialised in the treatment of individual cancer sites. All interested in these data are invited to order the book in the Registry.

ZAHVALA

Zdravniki, medicinske sestre in administrativno osebje iz slovenskih bolnišnic in drugih zdravstvenih ustanov so Registru pošiljali prijavnice s podatki o novih bolnikih z rakom in njihovi nadaljnji usodi in nam pomagali dopolnjevati prijave z manjkajočimi informacijami.

Vsaj polovico podatkov, obdelanih v tem poročilu, sta prispevali sodelavki Bolnišničnega registra Onkološkega inštituta v Ljubljani Ana Dotzauer in Maruška Ferjančič.

Naše delo bi bilo bistveno težje brez dolgoletnega sodelovanja s Centralnim Registrom prebivalstva RS, z Inštitutom za varovanje zdravja RS in Statističnim uradom RS.

Vsem imenovanim in tudi drugim, ki so kakorkoli prispevali, da smo lahko prikazali rezultate našega dela v tem poročilu, se najlepše zahvaljujemo.

Uredniški odbor

ACKNOWLEDGEMENT

Physicians, nurses, and administrative staff from Slovenian hospitals and other health institutions have provided the data on new cancer patients and their medical history as well as helped us in obtaining additional information when needed.

Our co-workers at the Hospital Registry of the Institute of Oncology, Mrs. Ana Dotzauer and Maruška Ferjančič have contributed at least a half of the information presented in this report.

The long-term collaboration with the Population Registry of the Republic of Slovenia, the Institute of Public Health of the Republic of Slovenia and the Statistical Office of the Republic of Slovenia is indispensable for our work.

We thank all of them as well as to all others who have helped to present the results of our work in this report.

Editors
